BayOne AI Solutions - Portfolio Overview

Introduction

BayOne's AI practice delivers five core solution areas built on reusable architectures (70-80% repeatable, 20-30% customization). These solutions address the most critical enterprise AI needs across industries where BayOne already has client relationships. Each solution includes multiple integrated capabilities designed to work together, with fast time-to-value (4-12 week POCs) and clear paths from proof-of-concept to production deployment.

---

1. Developer Productivity Suite

Integrated AI capabilities that accelerate software development, improve code quality, and enable rapid prototyping.

- **AI Code Copilots** - Custom VS Code extensions with industry-specific compliance modules (SOC 2, HIPAA, GDPR); subscription-based product model
- **Automated Code Review & QA** - Agentic systems for bug detection, security scanning, compliance checking, CI/CD quality gates
- **Rapid POC/Prototype Delivery** - Internal agent-based code generation delivering functional prototypes in days instead of weeks
- **AI-Powered UI/UX Design & Prototyping** - Multi-modal AI generates designs from sketches or requirements; three-tier upsell (Design → Prototype → Production)

For: Tech/SaaS, Financial Services, Healthcare, Consulting, any organization with development teams

- 51% of enterprises already deployed code generation tools
- Developer productivity: 35-40% faster code completion
- Telco AI ops: 58% reduction in manual intervention

Why this matters: Dual revenue model (subscription product + managed service). Enhances BayOne's developer staffing services. Addresses developer shortage, code quality consistency, and slow POC cycles. Clear upsell path from design to functional prototype to production solution.

---

2. Enterprise Automation & Services

Intelligent automation and workflow orchestration for enterprise operations, communication platforms, and business processes.

- **Intelligent Process Automation** - Autonomous systems handling exceptions, document understanding, and complex workflows with agent-to-agent coordination
- **Enterprise Tool Integrations** - AI-powered MCP-based agents for Microsoft Teams, Slack, Microsoft 365, ERP, CRM platforms
- **Meeting Intelligence & Automation** - Transcription, summarization, action item extraction, automated follow-ups, searchable archives with retention policies
- **Agentic Workflow Systems** - Multi-step autonomous operations for IT operations, customer service, incident response, provisioning

For: Universal - any enterprise using Microsoft 365, Slack, Teams, ERP/CRM systems

- Enterprise automation reducing manual intervention by 20-30%
- Meeting intelligence delivering productivity gains through automated documentation
- Custom integrations address organization-specific needs

Why this matters: Internal-first approach - build for BayOne operations, then sell proven solutions. Addresses disconnected workflows, lost meeting insights, and manual processes. Workflow automation delivers immediate, measurable ROI.

---

3. Data & Analytics Intelligence

Foundation layer for AI initiatives - data pipeline engineering, business intelligence, customer analytics, and synthetic data generation.

- **Data Pipeline Engineering & ETL** - End-to-end pipeline development for extraction, transformation, loading, data quality validation, and cleaning
- **Talk to Your Data / BI Agents** - Natural language interface to business data with MCP-based connectors to databases, APIs, data warehouses
- **Sales and Marketing Intelligence** - ML models for churn prediction, customer segmentation, personalized marketing, custom market research
- **Synthetic Data Generation** - AI-generated training data for ML projects blocked by insufficient, imbalanced, or privacy-restricted datasets

For: Any organization with data quality issues, siloed databases, legacy systems, or preparing for analytics/AI initiatives - especially Manufacturing, Healthcare, Financial Services, Retail

- Automated pipelines reduce manual data preparation by 70-90%
- Churn prediction: 20-25% reduction in customer attrition
- Marketing optimization: 25-30% cost savings through targeted campaigns

Why this matters: Clean, structured data foundation enables all downstream AI/analytics initiatives. Many organizations are stuck because of data chaos - this unlocks everything else. Addresses

Yogesh's "data cleaning" bucket directly.

---

4. Document Intelligence Platform

End-to-end platform for extracting, understanding, generating, and querying business documents using GenAI and computer vision.

- **Intelligent Document Processing** - Automated extraction and classification from any document type (PowerPoint, PDFs, scanned forms, complex layouts)
- **RAG-Based Knowledge Assistant** - Enterprise AI that answers questions using company documents with citations
- **Document Generation & Synthesis** - Automated creation of contracts, regulatory submissions, reports, proposals from templates and precedents
- **Multi-Modal AI Intelligence** - Combined visual and textual understanding for documents with images, charts, diagrams, and technical drawings

For: Insurance, Financial Services, Healthcare, Legal, Manufacturing, Retail - universal across industries

- JP Morgan COiN: 360,000 hours of legal review automated
- Morgan Stanley: 16,000 advisors querying 70,000+ research reports
- AstraZeneca: 70% reduction in time to compile regulatory submissions

Why this matters: Addresses manual document processing, knowledge trapped in files, legacy document digitization, and data preparation bottlenecks. Same core architecture works across insurance claims, loan applications, healthcare records, quality documentation, and contract analysis.

---

5. Manufacturing & Operations Intelligence

Computer vision, predictive analytics, and custom model deployment for manufacturing quality, equipment reliability, and operational optimization.

- **Computer Vision Quality Inspection** - Automated visual defect detection, compliance verification, dimensional measurement; applicable to any visual inspection task
- **Predictive Maintenance & Operations** - ML models for failure prediction, anomaly detection, operational optimization across equipment and software systems
- **Local Deployment & Custom Model Fine-Tuning** - On-premise or private cloud deployment of LLMs, CV models, ML models for IP-sensitive and regulated environments

For: Manufacturing, Food Processing, Pharma, Electronics, Automotive, Agriculture, Energy

- Beko: 66% defect reduction, 12.5% scrap reduction, 18% cycle time improvement
- GE Aviation: Predicts jet engine maintenance weeks in advance
- 50% of manufacturing companies refuse external APIs due to IP concerns

Why this matters: Deep domain expertise differentiator. Less competitive than GenAI-only consulting shops. Fast path to high-value manufacturing engagements. Addresses IP concerns and regulatory requirements (ITAR, FDA, HIPAA) that mandate on-premise deployment.
